

Temperature Control Mechanics

Temperature control mechanics work to maintain comfort levels in campus buildings.

Services

- Responding to hot, cold, and humidity calls
- Installing heating, ventilation, and air-conditioning (HVAC) systems, as well as new controls on all mechanical systems
- Maintaining and troubleshooting HVAC systems
- Installing and servicing air-compressor systems

Temperature control mechanics work with the HVACs of every building on campus. Each mechanic is skilled in their troubleshooting, repair, installation, and calibration. They are also experienced with both pneumatic and direct digital control HVAC systems.

Each mechanic is assigned their own route, giving them extensive knowledge of each building they work with. All mechanics use a work management system, which sends service calls directly to their phones, allowing for more immediate customer interaction.

Air compressor mechanics specialize in the installation and servicing of air-compressors, including air dryers and filters, on campus. Installation mechanics are responsible for installing the new controls on campus, as well as working on room remodels, air handler unit control upgrades, and heat exchanger controls.
